

DM Web App - Product Requirements Document (PRD)

1. Introduction

- **Document History:** DM Web App v 1.5 11/25
- **Problem Statement:** SMB decision makers deserve access to reliable, cost-effective technical solutions that address their unique challenges.
- **Vision/Goals:** I want to build a web application as a lead magnet that collects some basic information, delivers real value, and qualifies leads in a way that differentiates me from other 'expertise vendors'.

2. Product Scope

- **In-Scope:** Develop basic hypotheses, using preliminary research and AI tools, with data and description from the prospect, about a specific problem and the impact it has throughout the organization.
- **Out-of-Scope:** Not intended as an in-depth consultation, specific action plan or general strategy. However, while limited in scope and depth it must deliver some perceived value to the prospect.

3. User Stories & Personas

- **User Personas:**
 - **Persona: The Executive Problem-Solver**
 1. **Role:** CTO of a leading 3PL (Third-Party Logistics) company.
 2. **Goal:** To quickly find a fresh, innovative direction for a complex problem that their internal team is struggling to solve, without committing to a full-scale consulting engagement.
 3. **Need:** A limited advisory role that provides high-value insight to justify a small expenditure.
 - **Persona: The Manufacturing Innovator**
 1. **Role:** Owner of a small, well-established manufacturer of high-performance auto parts.
 2. **Goal:** To gain a foundational understanding of how to leverage AI tools to develop future products and improve their existing product line.
 3. **Need:** A brief, trustworthy outline and guidance from an expert who understands the unique constraints of their industry.
- **User Stories:**
 - As the CTO of leading 3PL (Third-Party Logistics) company, I need a quick, fresh take on a problem I'm facing that has my internal team stumped. We don't have the time or budget for a major consulting engagement, but if someone could point us in a promising new direction I could justify the expenditure for a limited advisory role.

- As the Owner of a small, well established manufacturer of high performance auto parts, I want to understand how to use AI tools in the development of future products and the improvement of our current line. If I could get a brief outline about where to begin from someone who understands our unique situation it would be a great value and create trust on our side.
- As an Account Manager for a major Cloud Computing provider, I sometimes need a quick hypothesis in response to a client's questions or concerns, but I need it to be from an impartial source to remain focused on the problem and avoid the appearance of an obvious up-sell. This is a huge help to my organization and a great exposure opportunity for your services.

4. Functional Requirements

○ **User Input Collection:**

- The system shall provide a user interface for collecting basic information about a problem the user is facing.
- The system shall allow the user to describe the nature of the problem.
- The system shall allow the user to describe the perceived impact of the problem.

○ **Hypothesis Generation:**

- The system shall process the user's input to generate a preliminary hypothesis about the problem's nature.
- The system shall generate a preliminary hypothesis about the problem's impact throughout the organization.
- The system shall utilize AI tools and preliminary research to formulate these hypotheses.

○ **Insight Generation:**

- The system shall use AI tools to generate relevant insights based on the problem description and its impact.
- The system shall present these insights in a way that highlights the organizational relevance of the problem.

○ **Output Delivery:**

- The system shall present the generated hypothesis and insights to the user.
- The output shall be concise and focused on the problem's impact.

- The output shall be delivered quickly after input submission.
- **Lead Qualification (Implicit):**
 - (While not explicitly a "functional" requirement in terms of user interaction, the system should be designed to implicitly gather data or trigger actions for lead qualification. This might involve backend processing or an integrated CRM system, but the user-facing part is the value delivery.)
 - The system shall capture user contact information (e.g., name, email) to facilitate follow-up for qualified leads. (This aligns with the "lead magnet" goal.)
- **Differentiation (Implicit):**
 - The system's output and presentation should be designed to convey "real value" and differentiate from generic advice. This translates to the quality and specificity of the generated hypotheses and insights.

5. Non-Functional Requirements

- **Performance:** While response times are important, accuracy and a cogent response to the client's input is our core value proposition.
- **Security:** Every effort should be made to protect the users data, but we must retain all interactions in a secure database for future reference.
- **Usability:** A clean, minimalist layout in a single page format should ensure ease of use. Refer to attached wireframes and style guide.
- **Compatibility:** This is a web based app, it must be compatible with as many browsers as possible and responsive to a wide range of screen sizes but operating system agnostic.

6. Assumptions & Constraints

- **Assumptions:** Users must have a stable internet connection and provide enough coherent data to craft a usable response.
- **Constraints:** This is a DIY project for a one-man shop. There is no pressing deadline but we must produce a delightful user experience on a shoestring budget.

7. Success Metrics

- **Key Performance Indicators (KPIs):**
 - 25 monthly active users.
 - 5% conversion rate
 - 90% customer satisfaction

- **Objectives and Key Results (OKRs):** This is the tool that will launch the business in the minds of our target market and set the standard for everything to come. The ultimate goal is a complete disruption of the consulting world. By January 1st 2026:
 - Meet all requirements and pass internal testing
 - Acquire 10-15 users and collect feedback
 - Identify 4-5 qualified leads
 - Achieve an initial positive user feedback of 50% or higher
 - Record our first referral inquiries.

8. Technical & Design Dependencies

- **Technical Dependencies:** This will be a single-page application (SPA) using React, from Hugging Face: GPT models for insight and hypothesis generation, BERT models for sentiment analysis and lead qualification, CRM: HubSpot/Mailchimp API, WebFlow, Jamstack, .
- **Design Dependencies:** Observable for data visualization, [login mockup](#) [UI/UX prototype](#) [design system](#)
